

## **Circuit Description**

When press down each function button(1, 2&3 in parallel, 4, 5) on the remote controller,( forward, backward, left, right), LED indicator turns on, and IC(TX2) chip will output high level signal corresponding to each function, this signal will be restored and recoded after IC built-in alternating/direct exchange system, then output. Simultaneously, when output recoded signal, IC chip outputs high level signal via PC pin, this amplified signal and coded signal will be converted into modulated wave, thereafter, modulated wave is transmitted via antenna. The crystal is 27.15MHz.
